Deliverable 2

PCA, CA and Clustering

Júlia Gasull i Claudia Sánchez

November 15, 2020

Contents

1 First setups

```
if(!is.null(dev.list())) dev.off()  # Clear plots
rm(list=ls())                       # Clean workspace
```

1.1 Load Required Packages for this deliverable

We load the necessary packages and set working directory

```
#setwd("~/Documents/uni/FIB-ADEI-LAB/deliverable2")
#filepath<-"~/Documents/uni/FIB-ADEI-LAB/deliverable2"
setwd("C:/Users/Claudia Sánchez/Desktop/FIB/TARDOR 2020-2021/ADEI/DELIVERABLE1/FIB-ADEI-LAB/deliverable2
filepath<-"C:/Users/Claudia Sánchez/Desktop/FIB/TARDOR 2020-2021/ADEI/DELIVERABLE1/FIB-ADEI-LAB/delivera

# Load Required Packages
options(contrasts=c("contr.treatment","contr.treatment"))
requiredPackages <- c("missMDA","chemometrics","mvoutlier","effects","FactoMineR","car", "factoextra","F
missingPackages <- requiredPackages[!(requiredPackages %in% installed.packages()[,"Package"])]
if(length(missingPackages)) install.packages(missingPackages)
lapply(requiredPackages, require, character.only = TRUE)
```

1.2 Load processed data from first deliverable

```
load(paste0(filepath,"/Taxi5000_del1.RData"))
```

1.3 Clean data

```
# remove some columns
names(df)
```

```

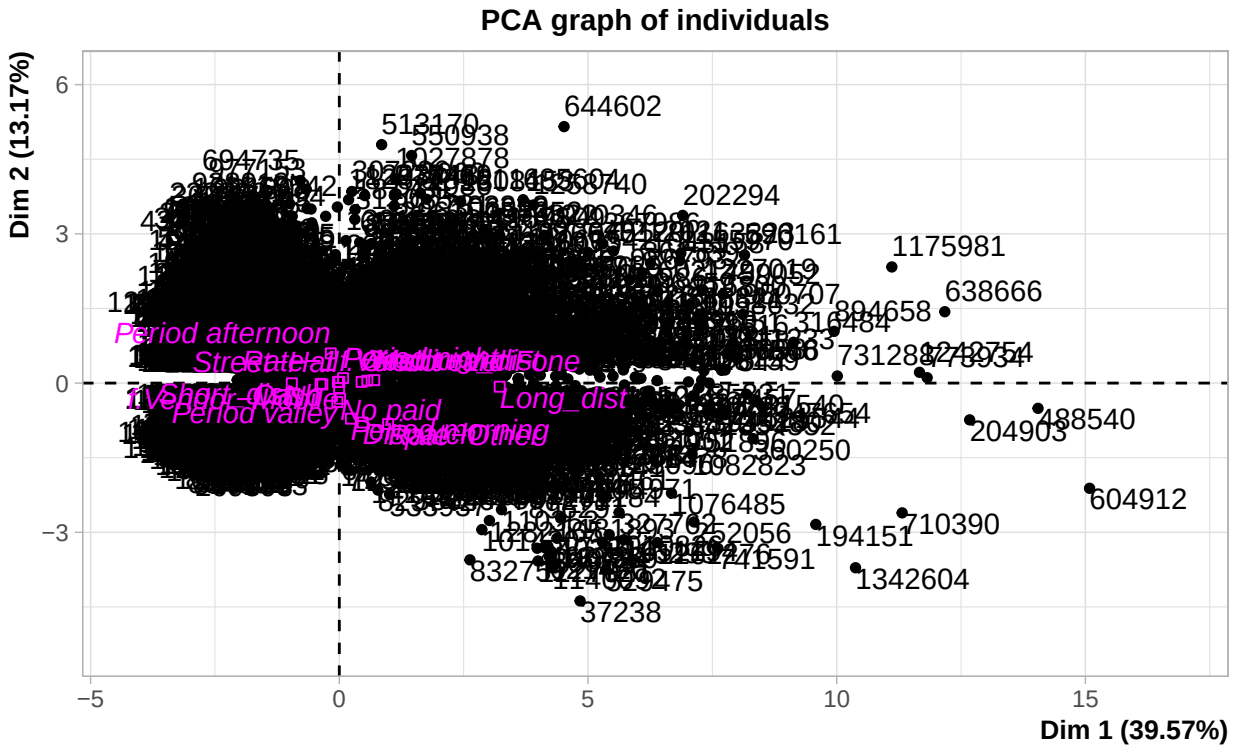
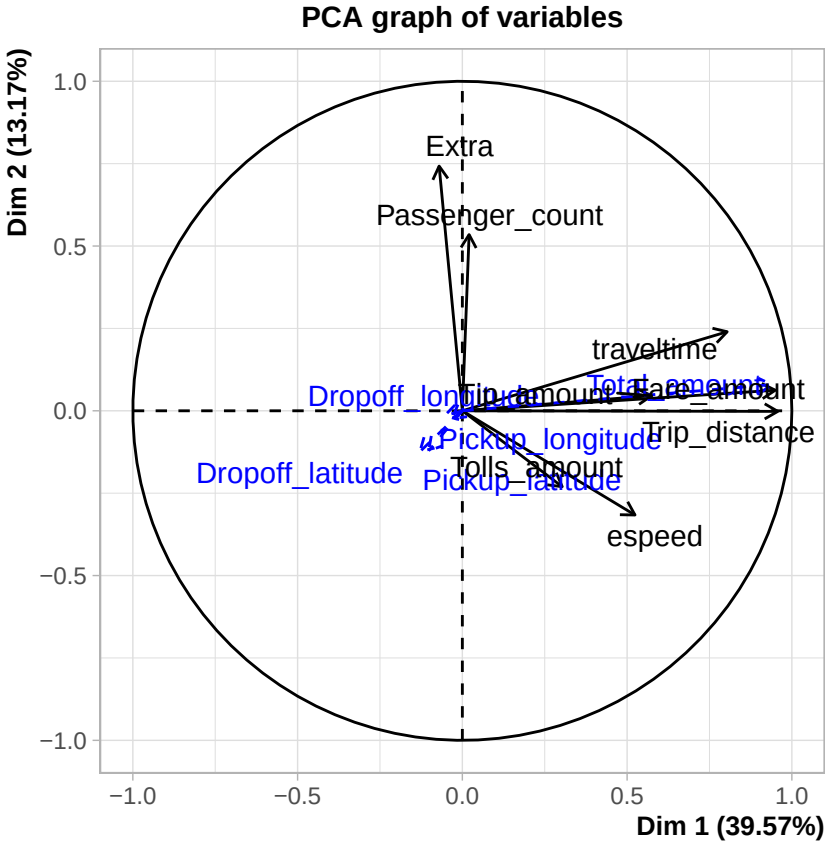
Note - web that we used in order to use factoextra
* http://www.sthda.com/english/wiki/wiki.php?id_contents=7851&fbclid=IwAR01E5XVvCrSKnpkCdAppbpvv7YMGvxSWaSSwb4SIgrXjrxoIpMIlNblYFY

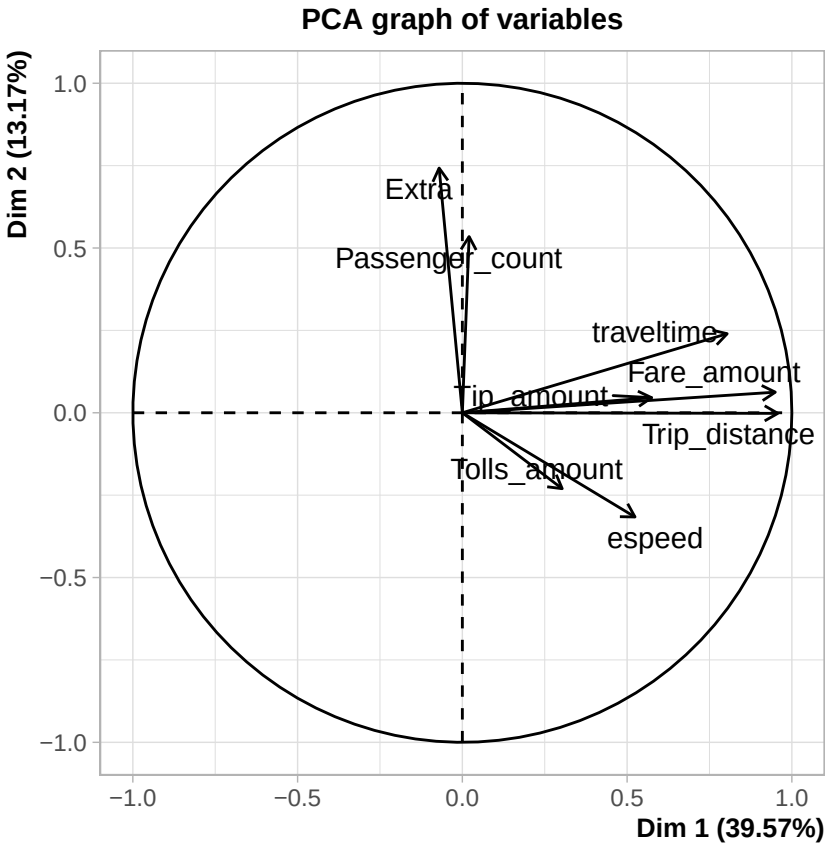
We have already seen profiling in the previous installment. So now, let's proceed to look at the main components.

```
library(FactoMineR)
res.pca <- PCA(df[,c(1:10,12,13,15:17,19,21,22,25,27)],quanti.sup=c(3:6,13),quali.sup=c(1,2,14:16,19:20)
```

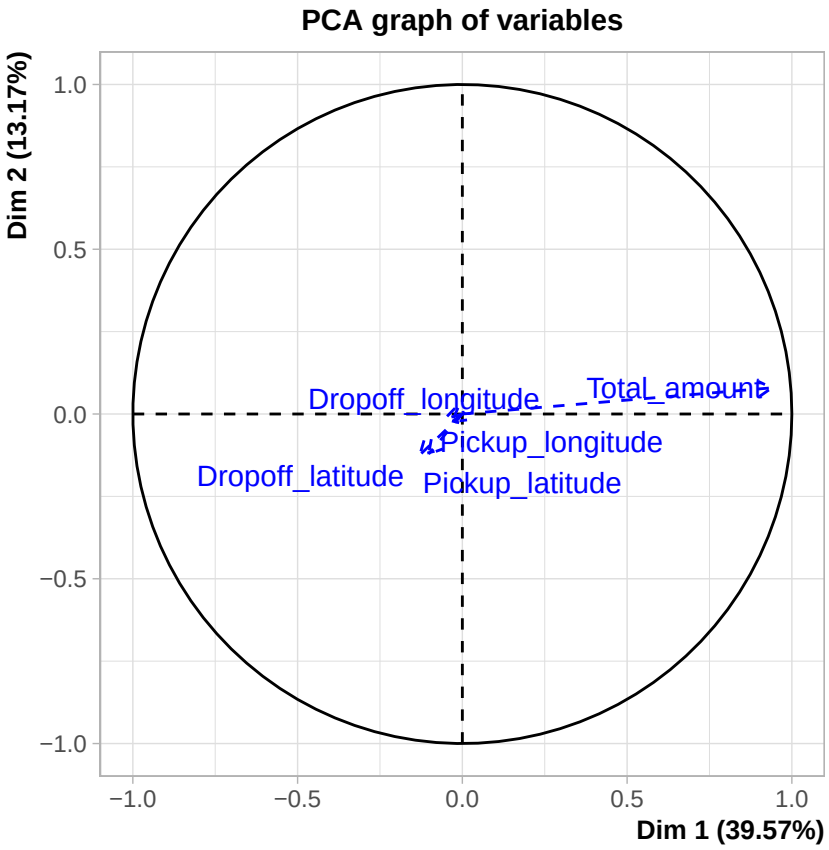




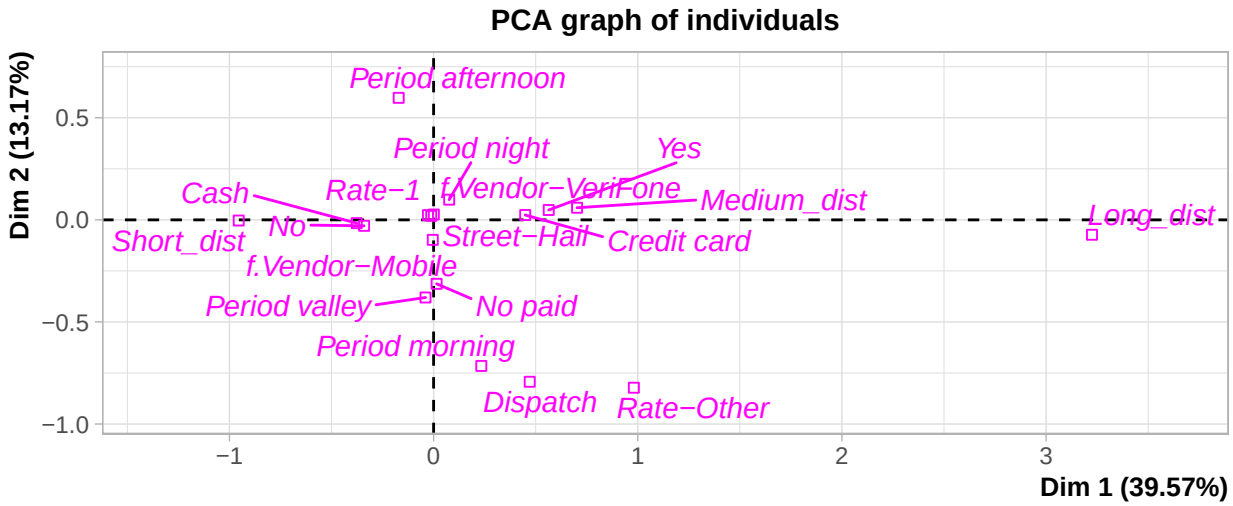
```
plot.PCA(res.pca,choix=c("var"), invisible=c("quanti.sup"))
```



```
plot.PCA(res.pca,choix=c("var"), invisible=c("var"))
```



```
plot.PCA(res.pca,choix=c("ind"), invisible=c("ind"))
```



Multivariant outliers should be included as supplementary observations:

```
# TO DO: explicar quins son multivariant outliers, la profe diu al video del 23/10 que aquests son uns p
```

2.1 Eigenvalues and dominant axes analysis

Eigenvalues correspond to the amount of the variation explained by each principal component (PC). Eigenvalues are large for the first PC and small for the subsequent PCs.

```
summary(res.pca, nb.dec=2,nbind=1, nbelements = 1000, ncp=5)
```

```
##

2.1.1 How many axes we have to interpret according to Kaiser?

A PC with an eigenvalue > 1 indicates that the PC accounts for more variance than accounted by one of the original variables in standardized data. This is commonly used as a cutoff point to determine the number of PCs to retain, using the Kaiser criteria.

```
eigenvalues <- res.pca$eig
head(eigenvalues[, 1:3])
```

```
##        eigenvalue percentage of variance cumulative percentage of variance
## comp 1  3.1654602              39.568252                           39.56825
## comp 2  1.0538386              13.172983                           52.74124
## comp 3  1.0394009              12.992511                           65.73375
## comp 4  0.9538540              11.923175                           77.65692
## comp 5  0.8970712              11.213390                           88.87031
## comp 6  0.7211678               9.014597                           97.88491
```

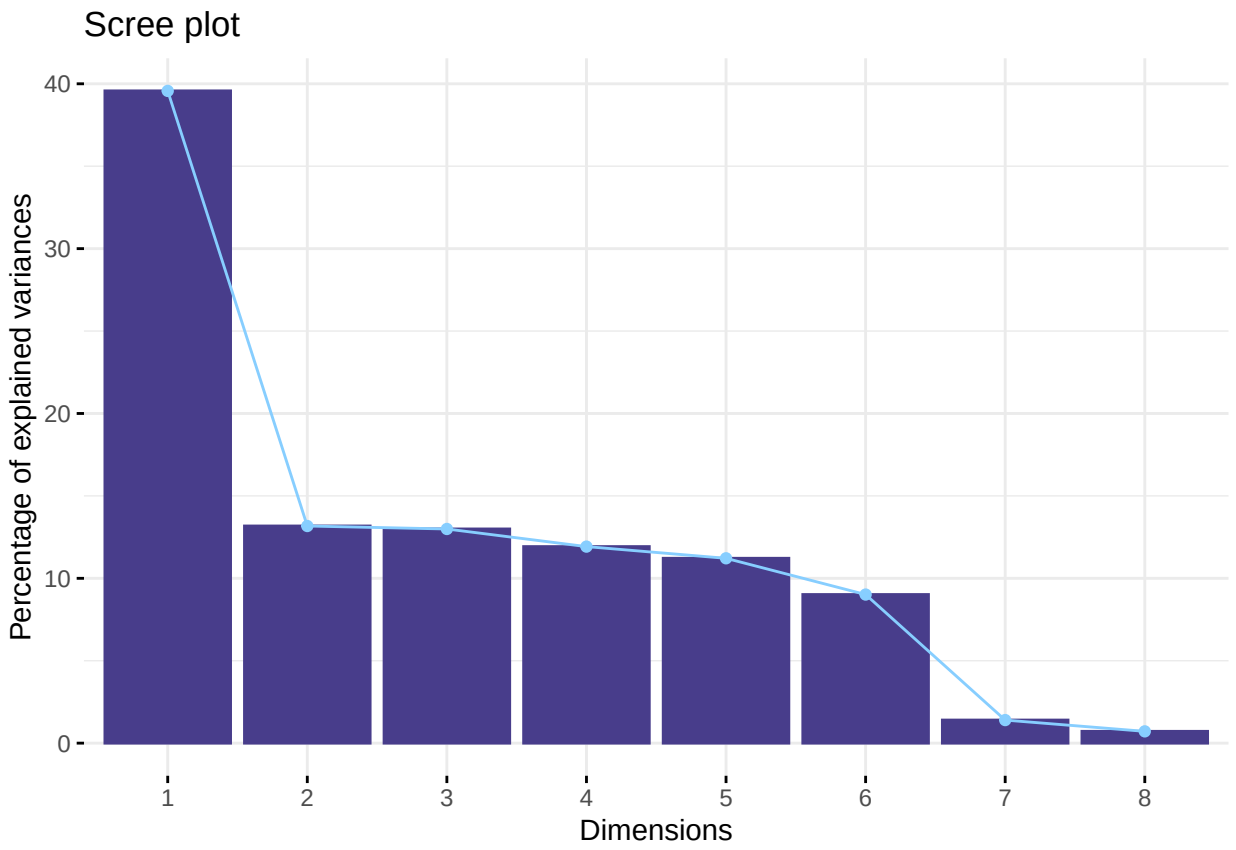
In this case, then, we will use up to dimension 3, and they will explain 65.73% of the total inertia.

2.1.2 How many axes we have to interpret according to Elbow's rule?

As a brief definition, we would say that the elbow rule is based on selecting dimensions until the difference in variance of that of the next factorial plane is almost the same as that of the current plane.

So let's look at exactly where we have this minimal difference:

```
fviz_screeplot(
  res.pca,
  barfill = "darkslateblue",
  barcolor = "darkslateblue",
  linecolor = "skyblue1"
)
```



We could say, then, that there is little difference between dimension 3 and 4, or between 5 and 6. Therefore, we could be left with 3 dimensions (as with Kasier) or 5.

2.2 Individuals point of view

2.2.1 Contribution

```
head(res.pca$ind$contrib) # contribition of individuals to the princial components
```

```

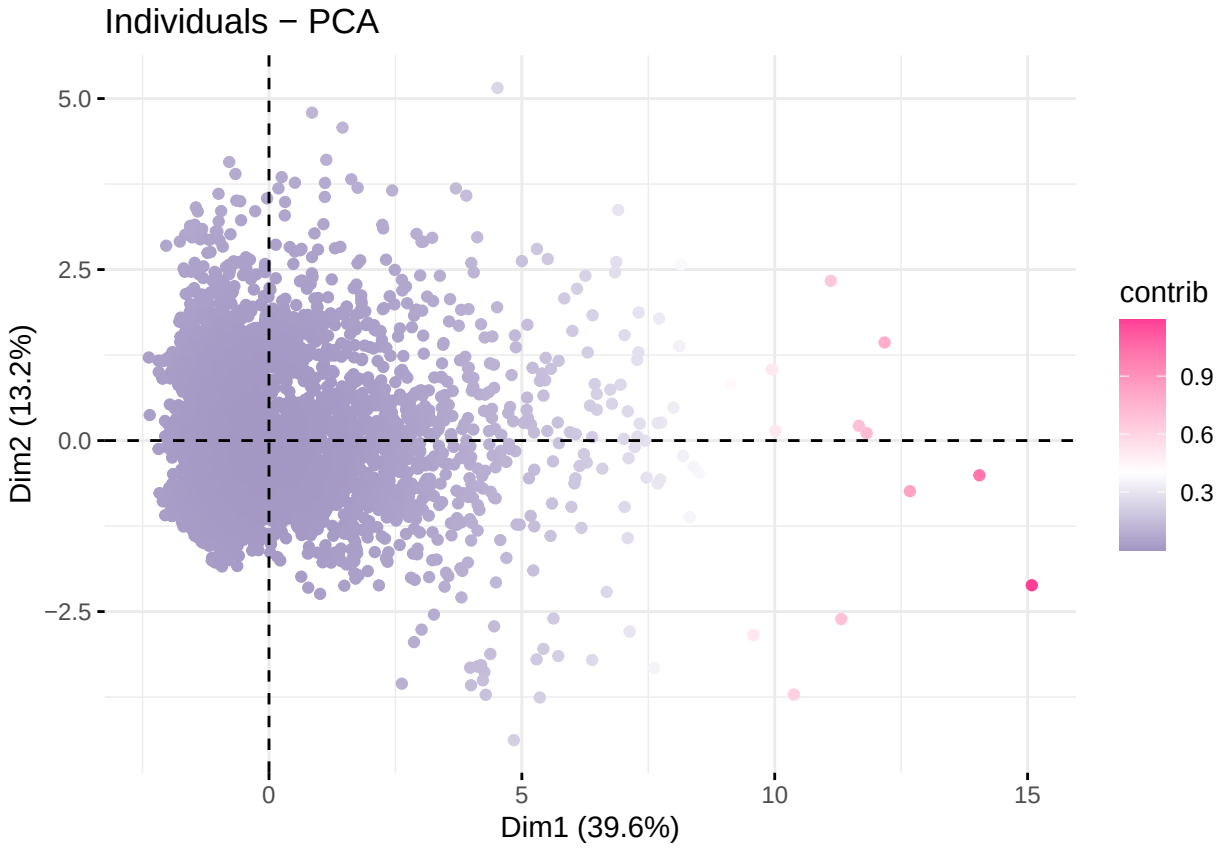
## 1807 0.009131625 3.380623e-05 1.298368e-05 0.009512722 5.867972e-05
```

```
fviz_pca_ind(res.pca, col.ind="contrib", geom = "point") +
scale_color_gradient2(low="darkslateblue", mid="white",
                      high="violetred1", midpoint=0.40)
```

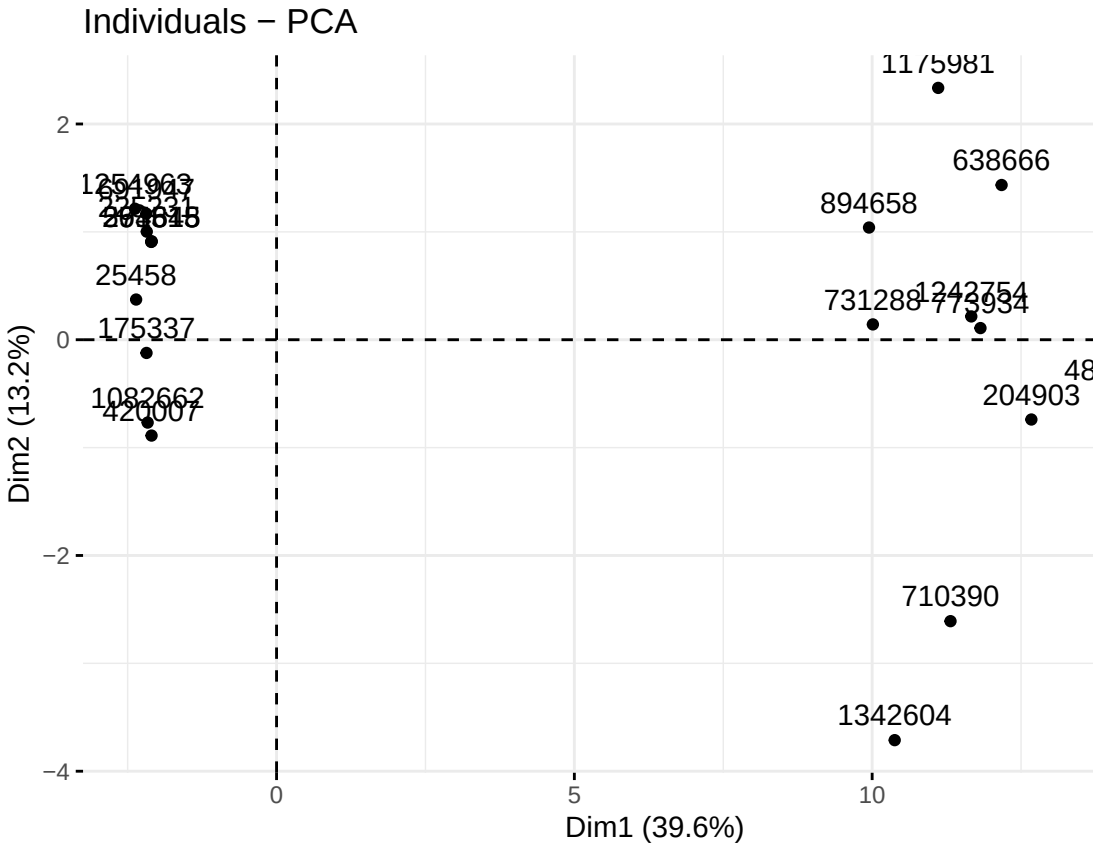


We can see that there are some individuals that are too contributive. So now, let's try to understand them better with extreme individuals.

2.2.2 Extreme individuals

```
rang<-order(res.pca$ind$coord[,1])
contrib.extremes<-c(row.names(df)[rang[1]], row.names(df)[rang[length(rang)]])

contrib.extremes<-c(row.names(df)[rang[1:10]], row.names(df)[rang[(length(rang)-10):length(rang)]])
fviz_pca_ind(res.pca, select.ind = list(names=contrib.extremes))
```



2.2.2.1 In dimension 1:

We can now have a look at them:

```
df[which(row.names(df) %in% row.names(df)[rang[(length(rang)-10):length(rang)]]), 1:28]
```

```

```

In the first dimension we see that for the **quantitative** variables the most positively related, from more to less, are: * Trip_distance (0.95) * Fare_amount (0.94) * Total_amount (0.93) * traveltime (0.80)

If we take look at the **qualitatives** ones, we that the most related is * Trip_distance_range (0.69)

Finally, if we take a look at the **categories** we see that for the Trip_distance_range category long distance trips show a mean 2.23 units over the global mean and short distance ones show a mean -1.94 units under the global mean, so we can reject the H0 done in the t.Student test.

2.3.2 Second dimension

```

##
## attr(,"class")
## [1] "condes" "list "
```

For the second dimension we see that or the **quantitative** variables Extra and Passenger_count are the most positively related ones with 0.74 and 0.53 respectively.

If we see the **qualitative** variables we notice that period is the most related with 0.18 even though it is not a very remarkable data.

And we see that for this **category**, period afternoon mean is 0.69 units over the global mean and period morning mean, on the contrary, is -0.61 units under the global mean, so we can reject the H0 done in the t.Student test.

2.3.3 Third dimension

##
## attr(,"class")
## [1] "condes" "list "
```

For the last dimension we took into account, the third one, we see that the most related **quantitative** variables are: * Passenger_count (0.53) * Tolls_amount (0.53) * espeed (0.51),

For the inversely related one, we also see that traveltime time (-0.40).

For the **quanlitatives**, we see that period is the category that is more related with 0.36, even though it is not a big relation.

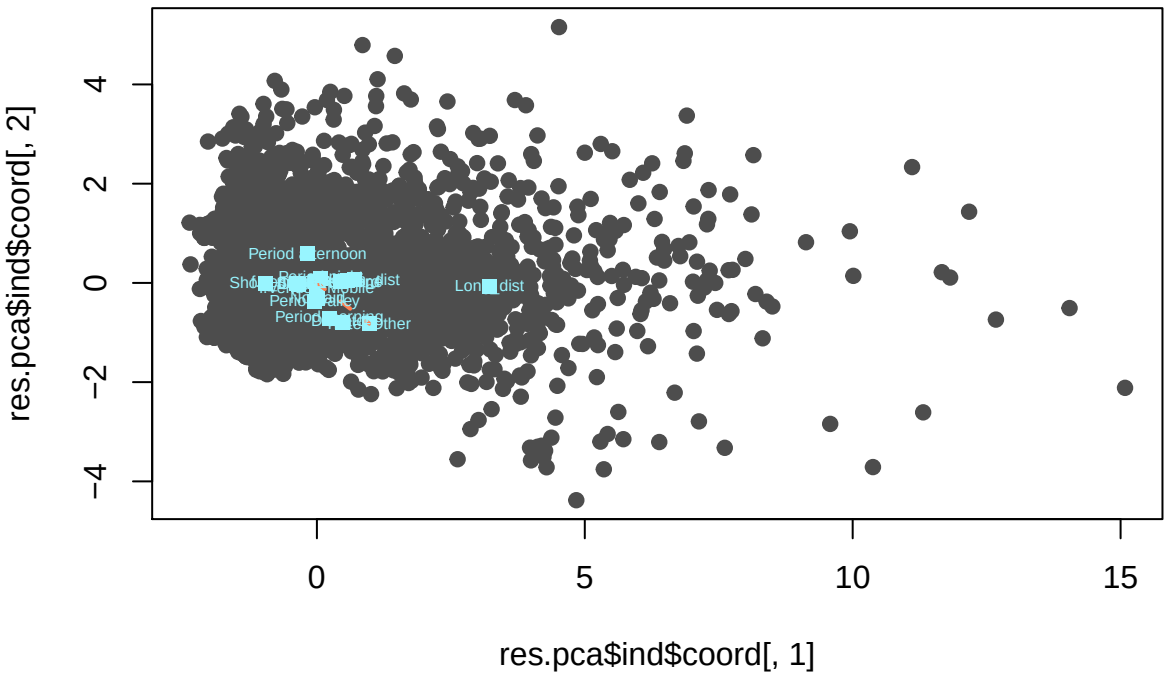
And we see that for this **category**, period afternoon mean is 0.28 units over the global mean and period valley mean, on the contrary, is -0.14 units under the global mean, hough it is not either a big relation.

We can conclude, then, that the first dimension is the one with the biggest correlations.

2.4 Perform a PCA taking into account also supplementary variables the supplementary variables can be quantitative and/or categorical

We want to take analyze the supplementary factor **kind of rate**, so we want to add lines that join the categories of this factor for the first factorial plane. With the following plot we can see it.

```
plot(res.pca$ind$coord[,1],res.pca$ind$coord[,2],pch=19,col="grey30") #draw all the individuals in grey
points(res.pca$quali.sup$coord[,1],res.pca$quali.sup$coord[,2],pch=15,col="cadetblue1") # points associ
lines(res.pca$quali.sup$coord[3:4,1],res.pca$quali.sup$coord[3:4,2],lwd=2,lty=2,col="coral") # draw a l
text(res.pca$quali.sup$coord[,1],res.pca$quali.sup$coord[,2],labels=names(res.pca$quali.sup$coord[,1]),c
```



```
res.pca$quali.sup$coord
```

```

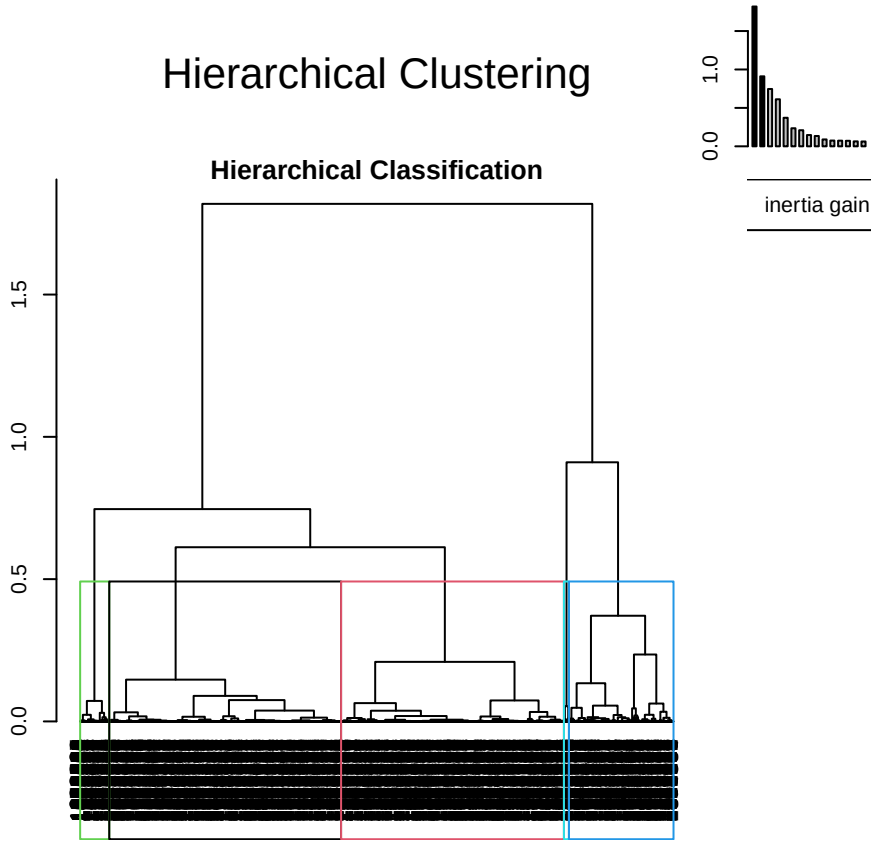
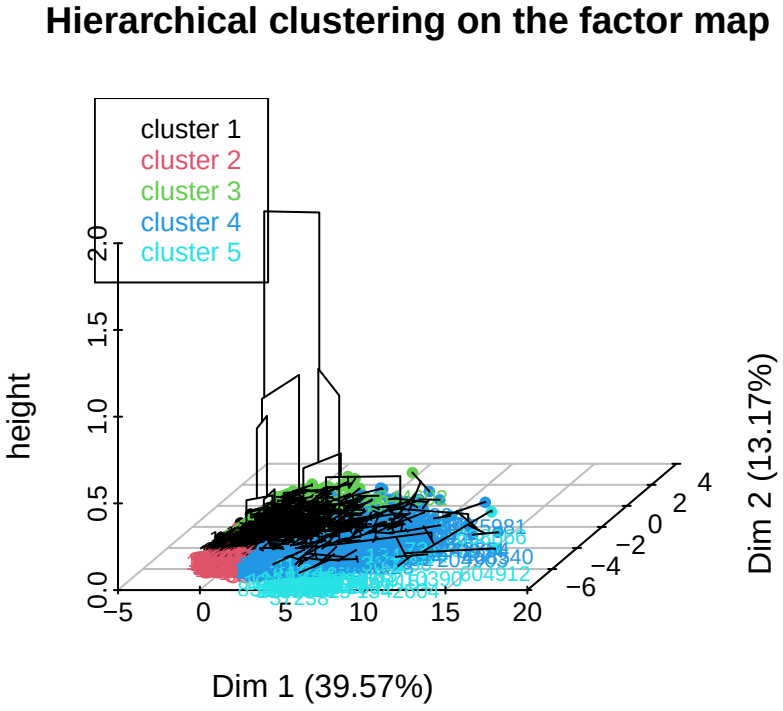
3 Hierarchical Clustering

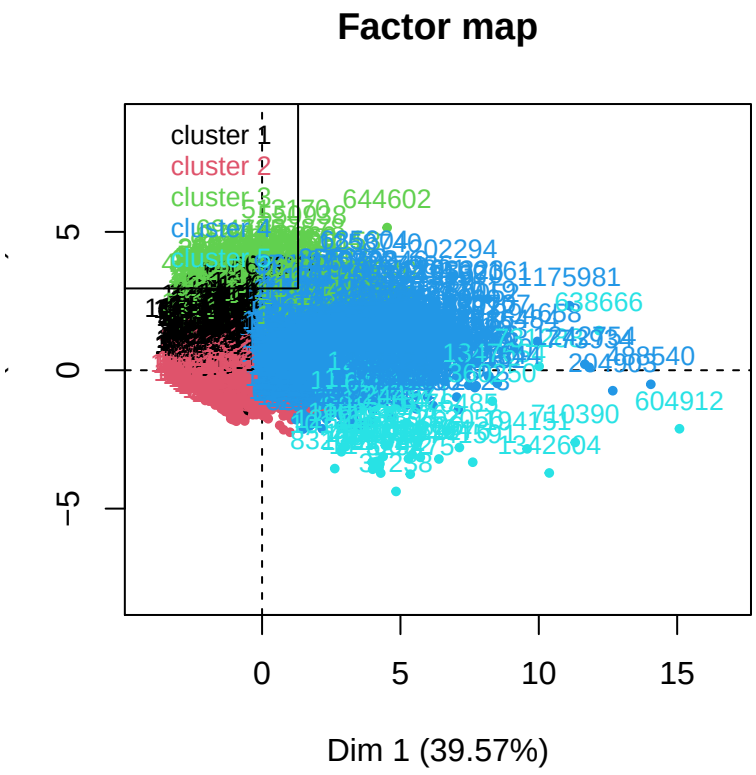
```
res.hcpc <- HCPC(res.pca,nb.clust = 5, order = TRUE)
```



Hierarchical Clustering
inertia gain
Hierarchical Classification
0.0
0.5
1.0
1.5



Hierarchical clustering on the factor map
cluster 1
cluster 2
cluster 3
cluster 4
cluster 5
height
Dim 1 (39.57%)
Dim 2 (13.17%)



Note: If we chose the default number of cluster it would be 3, as we can guess from the inertia reduction plot, that follows the Elbow's rule (number of black lines plus 1). In our case, due to the amount of data we have, the reason why we chose 5 as the number of clusters is because, after trying different numbers, we thought it was the best way to distribute the data.

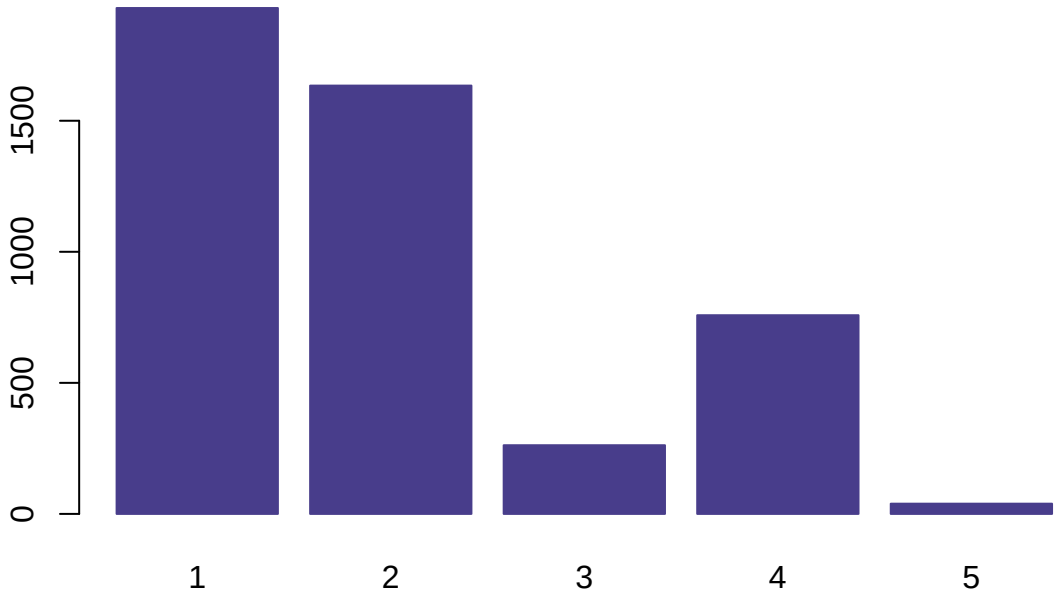
3.1 Description of clusters

Number of observations in each cluster:

```
table(res.hcpc$data.clust$clust)
```

```
##
##    1    2    3    4    5
## 1930 1634  262  758   39
```

```
barplot(table(res.hcpc$data.clust$clust), col="darkslateblue", border="darkslateblue", main="[hierarchic
```



##Interpret the results of the classification

3.1.1 The description of the clusters by the variables

```
names(res.hcpc$desc.var)
```

```

## VendorID              2.096463e-08  4
```

We start wit the description of the categorical variables that characterizes the clusters, so in this output we do not have dimensions because it is the total association. We can see the intensity of the variables, in our case the variable that affects more to the clustering is **period** because is the one with the smallest p.value. The variables associated to the clusters are:

- period
- Trip_distance_range
- TipIsGiven
- Paymnet_type
- VendorID

Next, we want to see for each cluster which are the categories that characterize them.The clusters that contain more individuals are the first, the second and the fourth one. Cluster number 4 has less individuals. We proceed to analyze them.

```
res.hcpc$desc.var$category    # description of each cluster by the categories
```

```

```

Cluster 1 The first thing we can notice from this cluster is that **Trip_type=Street-Hail** that intervents in

the 97.58% from the sample, in this cluster is the 100% of the observations, which means that all the observations in this cluster have this type of trip. We have 42.78% from the Trip_type=Street-Hail observations in this cluster. As we can see and expect, from the other trip_type that we have in this cluster is that **Trip_type=Dispatch** that intervents in the 2.42% from the sample, in this cluster is not represented, we get 0% of the observations. Then, we can notice is the kind of rate. We can see that **RateCodeID=Rate-1**, the one that represents the standard rate, and means the 97.25% of our sample, in this cluster is the 99.95% of the observations, almost every observation from this cluster is a standard rate trip. In this cluster we have 42.90% of the observations from this category. In the other hand, we have the kind of rate, that contains the other options, represents the 2.75% of our sample, in this cluster is the 0.05% of the observations. In this cluster, we have the 0.79% of the observations from this category.

Cluster 2 The first thing we can notice from this cluster is that **RateCodeID=Rate-1** (standard rate) and **Trip_type=Street-Hail** are the most represented in the cluster. We have 94.98% of the observations in the cluster that represent street-hail trips, and we also have 94.86% of the observations in the cluster that represent the standard rate trips. We have 74.72% of the morning period trips of the observations in the sample represented in this cluster, 73.21% of the dispatch type trips of the observations in the sample represented in this cluster, 66.59% of the valley period trips of the observations in the sample represented in this cluster, we also have the 66.14% of the other kind of rates f the observations in the sample represented in this cluster. In the other hand, we only have 3.16% of the long distance trips in the sample represented in this cluster and this category only means the 1.29% of the observations in the cluster of this category. We have 10.11% of the night period trips in the sample represented in this cluster and we have almost 19% of the afternoon period trips in the sample represented in this cluster.

Cluster 3 The first thing we can notice from this cluster is that almost every observation is from standard rate kind. We can see that 99.24% of the observations in the cluster are **RateCodeID=Rate-1**, and the cluster contains the 5.78% of the observations in the sample of this kind. The rest of observations in the cluster are from **RateCodeID=Rate-Other** kind.The next thing we can notice from this cluster is that, also, almost every observation is from Verfione kind of vendor. We have the 94.27% of the observations in this cluster of **VendorID=f.Vendor-VeriFone** category. This categories represents the 78.95% from our sample, and the cluster contains the 6.77% of obervations of this kind. For the other kind of vendor, **VendorID=f.Vendor-Mobile**, that represents the 21.05% of our sample, we have that in this cluster, 5.73% of the observations are from this vendor, and the cluster contains 1.54% of observations of this kind. If we take a look at the period categories, we see that **period=Period night** represents 43.51% of the observations in the cluster, and we have the 6.94% of the observations of this kind from the sample. In this cluster the night period is over represented because this kind of period represents the 35.52% of observations from our sample. For the **period=Period valley**, we have 20.99% of the observations in the cluster of this kind of period. We have in this cluster 4.37% of the observations of this kind from our sample. The last kind of period that we have in this cluster is the moring one, that represents the 5.73% of the observations in the cluster and we have 2.77% of the observations from the sample of this kind in this cluster.

Cluster 4 In this cluster, we can see that the category more represented is **Trip_type=Street-Hail** with 96.31% of the observations in the cluster. We get 16.18% of the observations of this kind from the sample in the cluster. Another category that is very represented is the standard rate, **RateCodeID=Rate-1**, with 95.25% of the observations in the cluster. From the sample, we get in this cluster, 16.06% of the observations of this kind. We can notice that we have 87.52% of long distance trip observations from the sample in this cluster. We can see that this category is over represented in this cluster because this category represents the 14.38% of the sample, and 76.78% of the observations in the cluster are of this category. In the other hand, we can see that short distance trips that represents 1.85% of the observations in the cluster and we only got 0.47% of the observations of this kind from the sample.

Cluster 5 This cluster is the smallest one, we only have 39 observations from the sample. We can see in this cluster is that the **RateCodeID=Rate-1** represents the 89.75% of the observations in this cluster. In this cluster we only have 0.78% of the observations from the sample of this kind. The rest 10.25% are the **RateCodeID=Rate-Other** observtions in the cluster. In this case, we have a 3.15% of the observations from the sample of this kind in this cluster. Then we have that 82.05% of the observations in the cluster that paid credit card, and we got 1.53% of the observations from sample sample of this kind this cluster. The other 17.95% of the observations in the cluster paid in cash, and we got less representation from the sample in this cluster for this category, we only got 0.28% of the observations from the sample.

We now proceed to see the quantitatives variables that characterizes the clusters.

## Dropoff_latitude  0.018549311  7.346910e-18
## Pickup_latitude   0.016472560  8.618675e-16
## Dropoff_longitude 0.009820162  3.006725e-09
## Pickup_longitude  0.004646807  2.504182e-04
```

We can see in the output that all the variables that appear are slightly over represented in the clusters. We can notice that the greatest represented is the Total_amount with 0.98 units over the global mean, we can also remark the Passenger_count with 0.78 units over the mean and the Extra variable with 0.63 units over the mean. The least over represented are the Pickup_longitude with 0.004 units over the mean, the Dropoff_longitude with 0.01 units over the mean, the Pickup_latitude with 0.016 units over the mean and the Dropoff_latitude with 0.02 units over the total mean.

We want to know now which variables are associated with the quantitative variables.

```

Cluster 1 For this cluster, we can see that the **traveltime** is around 3 units under the overall mean, the **Fare_amount** as well and the **Total_amount** too. We can also see that the **Trip_distance** is 1 unit under the overall mean and the **espeed** as well. We see that the only variable that is over the overall mean is the variable **Extra** with less than 0.3 units over it.

Cluster 2 For the second cluster, happens something similar as with the first one. We see that the **Total_amount** is around 3.7 units under the overall mean, **espeed** around 2 units under as well, **Tip_amount** around 0.5 under the overall mean too, **traveltime** and **Fare_amount** around 3 units under the overall mean as well, **Trip_distance** around 1 unit under the mean. In this clusters the only variables ver the overall mean are **Dropoff_latitude** and **Pickup_latitude** but they are not remarkable since the increase is super light.

Cluster 3 In this cluster we can see that the most remarkable variable is **Passenger_count** with almost 4 units over the overall mean, then we also have **Total_amount** with 0.1 units over the meant. In the other hand, we have **Total_amount** and **Fare_amount** with around 1 unit under the overall mean. **Trip_distance** is around 0.5 units under the overall mean.

Cluster 4 In this cluster we can see clearly the most remarkable vairables. We have 5 variables cleary over the overall mean. These are: **Total_amount** with 26 units over the mean, **Fare_amount** and **traveltime** with 14 units over the mean, **espeed** with 8 units over the mean and **Trip_distance** with 5 units over the overall mean.

Cluster 5 In this cluster every variable is over the overall mean. Every variable except **Pickup_longitude** are remarkably over the overall mean. Firstly, we have the **Total_amount** around 30 units over, then we have **Fare_amount** 18 units over, **espeed** 14 units over, **traveltime** 12 units over, **Trip_distance** 6 units over, **Tolls_amount** 5 units over and **Tip_amount** 3.7 units over the overall mean.

3.1.2 The description of the clusters by the individuals

```
res.hcpc$desc.ind$para  # representative individuals of each cluster
```

```
## Cluster: 1

```

What we obtain are those individuals of each cluster that that far away in the same cluster from the rest of the individuals. We also obtain the rownames of each individual with the bigger distance respect the other ones in the cluster.

3.1.2.1 Examine the values of individuals that characterize classes

We get the grpahical representation for the individuals that characterize classes (para and dist).

```
# characteristic individuals
para1<-which(rownames(res.pca$ind$coord)%in%names(res.hcpc$desc.ind$para[[1]]))
dist1<-which(rownames(res.pca$ind$coord)%in%names(res.hcpc$desc.ind$dist[[1]]))

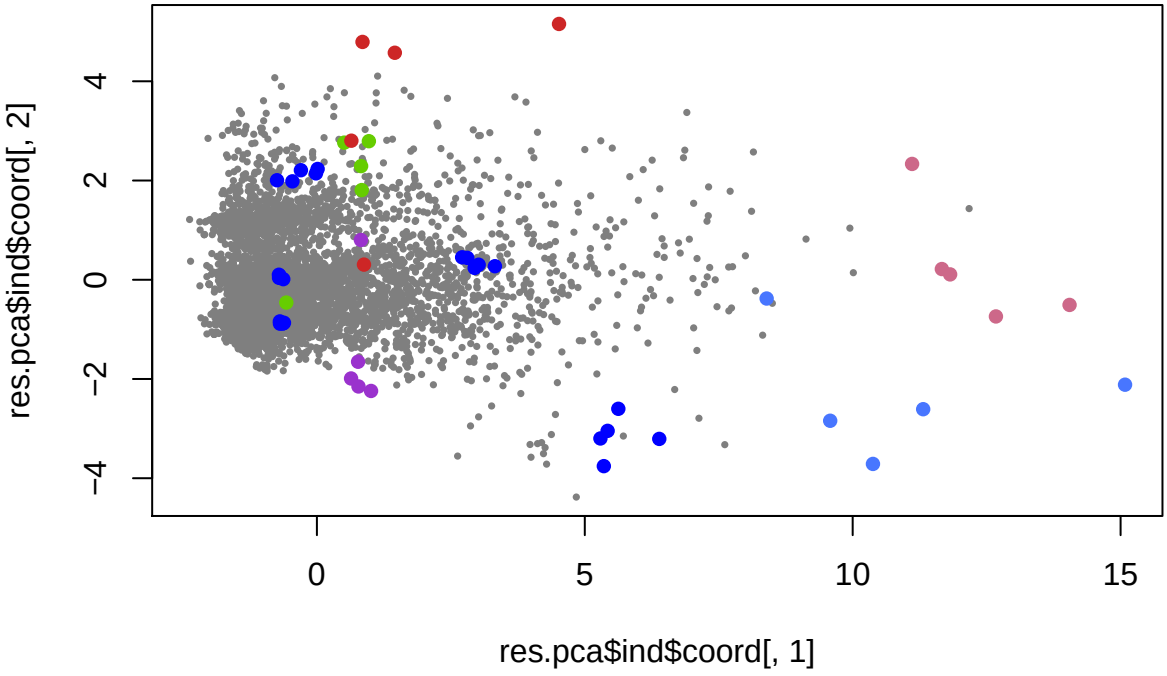
```



3.1.3 Partition quality

We are going to evaluate the partition quality.

```
#res.hcpc$call$t$within[1] = Total sum of squares
#(res.hcpc$call$t$within[1]-res.hcpc$call$t$within[5] = between sum of squares
((res.hcpc$call$t$within[1]-res.hcpc$call$t$within[5])/res.hcpc$call$t$within[1])*100
```

3.1.3.1 Gain in inertia (in %)

```
## [1] 57.49171
```

The quality of this reduction if of 57.49%.

In case we wanted to achieve an 80% of the clustering representativity we would need 18 clusters.

```
((res.hcpc$call$t$within[1]-res.hcpc$call$t$within[18])/res.hcpc$call$t$within[1])*100
```

```
## [1] 80.59951
```

3.1.4 Save the results into dataframe

```
res.hcpc$call$t$inert.gain[1:5]
```

```
## [1] 1.8187697 0.9105858 0.7460223 0.6120673 0.3712993
```

```
df$hcpck<-res.hcpc$data.clust$clust
```

---

4 K-Means Classification

4.1 Description of clusters

```
res.pca <- PCA(df[,c(1:10,12,13,15:17,19,21,22,25,27)],quanti.sup=c(3:6,13),quali.sup=c(1,2,14:16,19:20)
ppcc<-res.pca$ind$coord[,1:3] # 3 components principals (kaiser)
dim(ppcc)
```

```
## [1] 4623    3
```

4.1.1 Optimal number of clusters

```
library("factoextra")
#fviz_nbclust(ppcc, kmeans, method = "gap_stat")
```

According to the previous plot, the optimal number of clusters per k-means is 1, so we guess maybe something is wrong or missing.

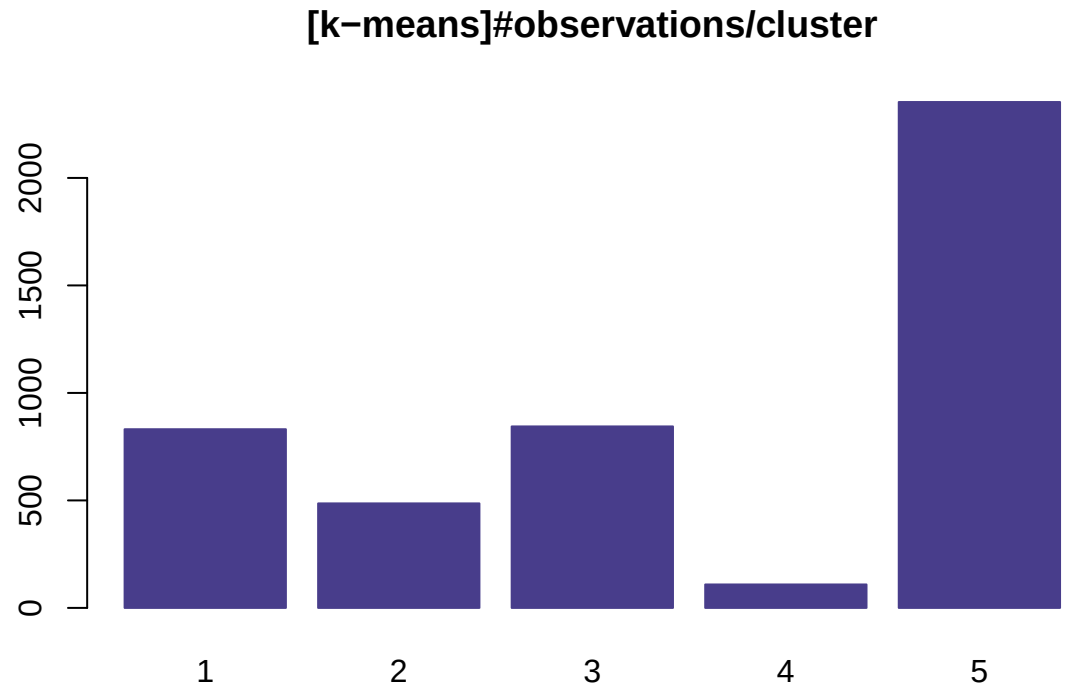
4.2 Classification

```
dist<-dist(ppcc)  # coordenates are real - Euclidean metric
kc<-kmeans(dist, 5, iter.max=30, trace=TRUE) #caclulate the distances, it turns into a matrix
```

```
## KMNS(*, k=5): iter=  1, indx=3
##  QTRAN(): istep=4623, icoun=0
##  QTRAN(): istep=9246, icoun=52
##  QTRAN(): istep=13869, icoun=6
##  QTRAN(): istep=18492, icoun=13
##  QTRAN(): istep=23115, icoun=1
##  QTRAN(): istep=27738, icoun=9
##  QTRAN(): istep=32361, icoun=27
##  QTRAN(): istep=36984, icoun=7
##  QTRAN(): istep=41607, icoun=49
##  QTRAN(): istep=46230, icoun=1
##  QTRAN(): istep=50853, icoun=6
##  QTRAN(): istep=55476, icoun=2
##  QTRAN(): istep=60099, icoun=777
## KMNS(*, k=5): iter=  2, indx=3
##  QTRAN(): istep=4623, icoun=25
##  QTRAN(): istep=9246, icoun=1
##  QTRAN(): istep=13869, icoun=5
##  QTRAN(): istep=18492, icoun=21
##  QTRAN(): istep=23115, icoun=226
##  QTRAN(): istep=27738, icoun=926
##  QTRAN(): istep=32361, icoun=3
##  QTRAN(): istep=36984, icoun=483
##  QTRAN(): istep=41607, icoun=4591
## KMNS(*, k=5): iter=  3, indx=3
##  QTRAN(): istep=4623, icoun=225
##  QTRAN(): istep=9246, icoun=690
##  QTRAN(): istep=13869, icoun=3645
## KMNS(*, k=5): iter=  4, indx=4623
```

We see from the output that in 4 iterations it has converged. We now procceed to save in the data frame the number of clusters.

```
df$claKM<-0
df$claKM<-kc$cluster
df$claKM<-factor(df$claKM)
barplot(table(df$claKM),col="darkslateblue",border="darkslateblue",main="[k-means]#observations/cluster"
```



4.2.1 Gain in inertia (in %)

The american school does the partition quality evaluation in 5 clusters is done very fast, and after executing the following chunk we get an explicability of the 77.99%

```
100*(kc$betweenss/kc$totss)
```

```
## [1] 79.40953
```

###kmeans clusters characteristics If we want to know the characteristics of each cluster, as we did with the hierarchical, we need to execute a catdes to obtain these characteristics. In the following output we get them, but we are not going to explain them because the process is the same as we already did in the hierarchical.

```
dim(df)
```

```
## [1] 4623   30
```

```
res.cat <-catdes(df,30)
res.cat
```

```
##
## Link between the cluster variable and the categorical variables (chi-square test)

4.2.2 Comparison of clusters (confusion table)

We want to compare the hierarchical clustering, previously done, and the kmeans clustering, so proceed to do the following.

```
table(df$hcpck,df$claKM)
```

```
##
##        1    2    3    4    5
##   1  239    7  694    0  990
##   2  261    2    8    0 1363
##   3    8  111  142    1    0
##   4  323  366    0   69    0
##   5    0    0    0   39    0
```

```
# we must do a relabel
df$hcpck<-factor(df$hcpck,labels=c("kHP-1","kHP-2","kHP-3","kHP-4","kHP-5"))
df$claKM<-factor(df$claKM,levels=c(3,5,2,1,4),labels=c("kKM-3","kKM-5","kKM-2","kKM-1","kKM-4"))
tt<-table(df$hcpck,df$claKM); tt
```

```
##
##         kKM-3 kKM-5 kKM-2 kKM-1 kKM-4
##   kHP-1   694   990     7   239     0
##   kHP-2     8  1363     2   261     0
##   kHP-3   142     0   111     8     1
##   kHP-4     0     0   366   323    69
##   kHP-5     0     0     0     0    39
```

```
100*sum(diag(tt)/sum(tt))
```

```
## [1] 54.72637
```

We have a concordance of the 54.73% so we can say that they are different, if we had a greater concordance, this would mean that they would be more similar.

---

5 CA analysis

5.1 Are there any row categories that can be combined/avoided to explain the discretization of the numeric target.

5.1.1 CA analysis for your data should contain your factor version of the numeric target (previous) in K= 7 (maximum 10) levels and 2 factors.

The first thing we need to do is factor our numeric target variable, Total_amount, and name it f.cost. We are going to set 6 different categories.

```
df$f.cost[df$Total_amount<=8] = "[0,8]"
df$f.cost[(df$Total_amount>8) & (df$Total_amount<=11)] = "(8,11]"
df$f.cost[(df$Total_amount>11) & (df$Total_amount<=18)] = "(11,18]"
df$f.cost[(df$Total_amount>18) & (df$Total_amount<= 30)] = "(18,30]"
df$f.cost[(df$Total_amount>30) & (df$Total_amount<= 50)] = "(30,50]"
df$f.cost[df$Total_amount>50] = "(50,129)"
df$f.cost<-factor(df$f.cost)
table(df$f.cost)
```

```
##
##  (11,18]  (18,30]  (30,50] (50,129)   (8,11]     [0,8]
##     1188      724      221       63     1151      1276
```

Once we have this factor, proceed to create a variable that associates the cost with the passenger groups, and we we a contingency table with 5 rows, one per kind of cost and 3 columns, one per each kind of group.

```
tt<-table(df[,c("f.cost","passenger_groups")]);tt
```

```
##           passenger_groups
## f.cost     Couple Group Single
##   (11,18]      77    89   1022
##   (18,30]      58    72    594
##   (30,50]      20    20    181
##   (50,129)      5     7     51
##   (8,11]       81   104    966
##   [0,8]       102   103   1071
```

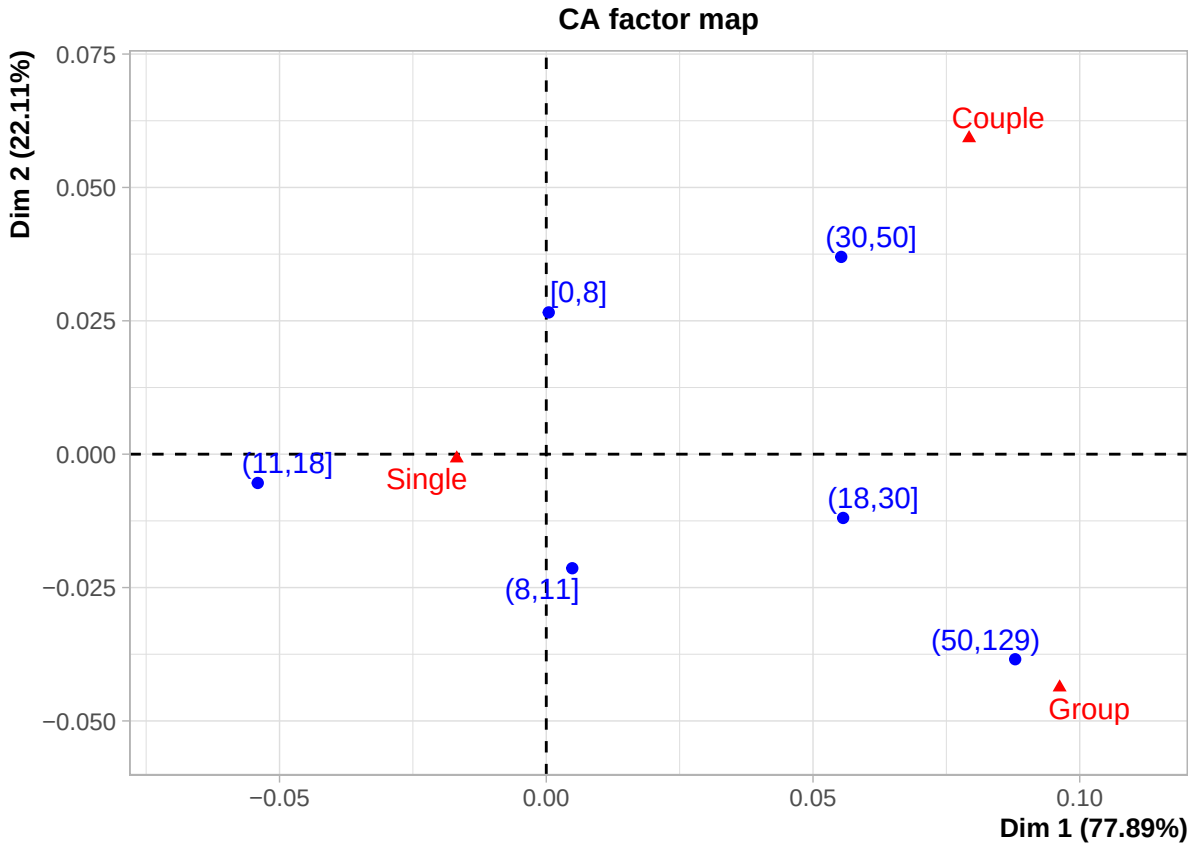
```
chisq.test(tt,  simulate.p.value = TRUE) #to see if the rows and columns are independents. H0: Rows and
```

```
##
##  Pearson's Chi-squared test with simulated p-value (based on 2000
##  replicates)
##
## data:  tt
## X-squared = 8.8677, df = NA, p-value = 0.5212
```

We get a p-value greater than 0.05 so we can assume the H0. ($0.5217 < 0.05 = \text{FALSE}$).

We are now going to take a look to the simple correspondences.

```
res.ca <- CA(tt)
```



Those observations far away from the gravity center will mean that represent less observations on the sample. If rows and columns are nearby, this will mean that there is a correspondence between them, which means that they occur simultaneously in the sample.

```
summary(res.ca, dig=2)
```

```
##
## Call:
## CA(X = tt)
##
## The chi square of independence between the two variables is equal to 8.867721 (p-value =  0.5447017 )
##

## (8,11]    |     0.120 |  0.005  0.396  0.049 | -0.021 26.828  0.951 |
## [0,8]     |     0.195 |  0.000  0.004  0.000 |  0.027 45.976  1.000 |
##
## Columns
##             Iner*1000    Dim.1    ctr   cos2    Dim.2    ctr   cos2
## Couple    |     0.726 |  0.079 31.197  0.642 |  0.059 61.383  0.358 |
## Group     |     0.955 |  0.096 52.961  0.829 | -0.044 38.494  0.171 |
## Single    |     0.237 | -0.017 15.841  0.998 | -0.001  0.122  0.002 |
```

We conclude that we can reject the H0 for these pair of factors, and now we are going to see if we can see if there is independence between the cost and the travel time, so the first thing we are going to do is factor the travel time.

```
df$f.tt[df$traveltime<=5] = "[0,5]"
df$f.tt[(df$traveltime>5) & (df$traveltime<=10)] = "(5,10]"
```

```
df$f.tt[(df$traveltime>10) & (df$traveltime<=15)] = "(10,15]"
df$f.tt[(df$traveltime>15) & (df$traveltime<= 20)] = "(15,20]"
df$f.tt[(df$traveltime>20) & (df$traveltime<= 50)] = "(20,50]"
df$f.tt<-factor(df$f.tt)
table(df$f.tt)
```

```
##
## (10,15] (15,20] (20,50]  (5,10]    [0,5]
##     913     549     694    1511     894
```

Once we have this factor, proceed to create a variable that associates the cost with the traveltime.

```
tt<-table(df[,c("f.cost","f.tt")]);tt
```

```
##           f.tt
## f.cost     (10,15] (15,20] (20,50] (5,10] [0,5]
##   (11,18]      613     314      88    156     8
##   (18,30]      106     205     388      3    15
##   (30,50]        1      23     175      2     4
##   (50,129)       1       1      35      0     7
##   (8,11]       189       3       4    864    85
##   [0,8]          3       3       4    486   775
```

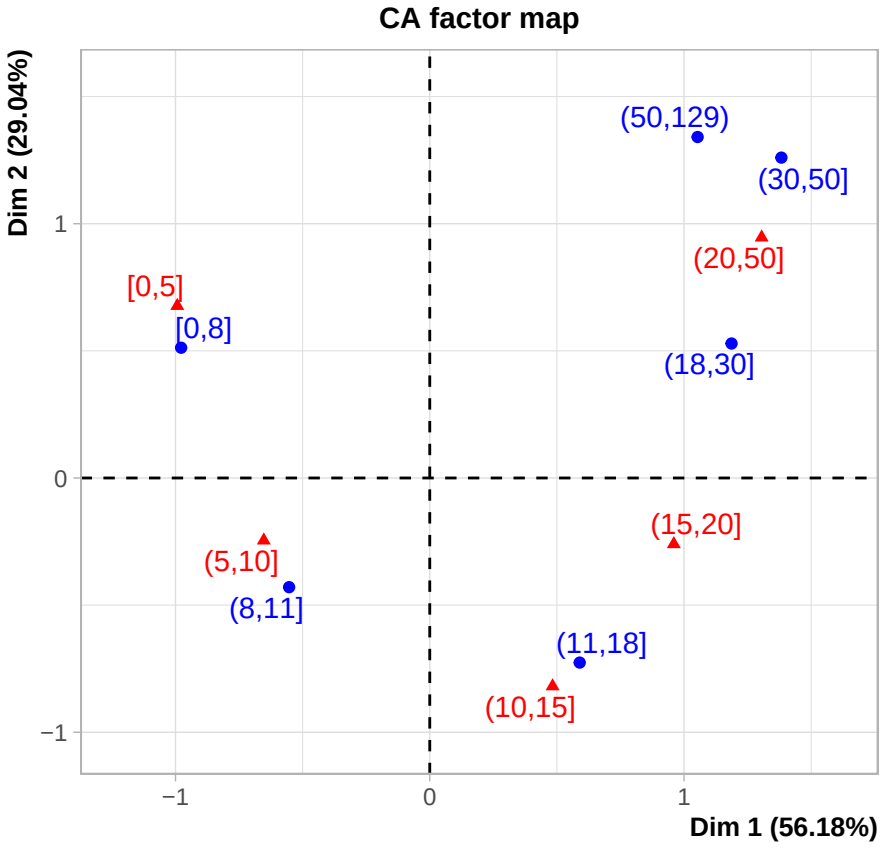
```
chisq.test(tt) #to see if the rows and columns are independents. H0: Rows and columns are independent
```

```
##
##  Pearson's Chi-squared test
##
## data:  tt
## X-squared = 6099.3, df = 20, p-value < 2.2e-16
```

We get a p-value smaller than 0.05 so we can reject the H0. ($(< 2.2e\text{-}16) < 0.05$). So there is dependence between the traveltime and the cost, as we suspected.

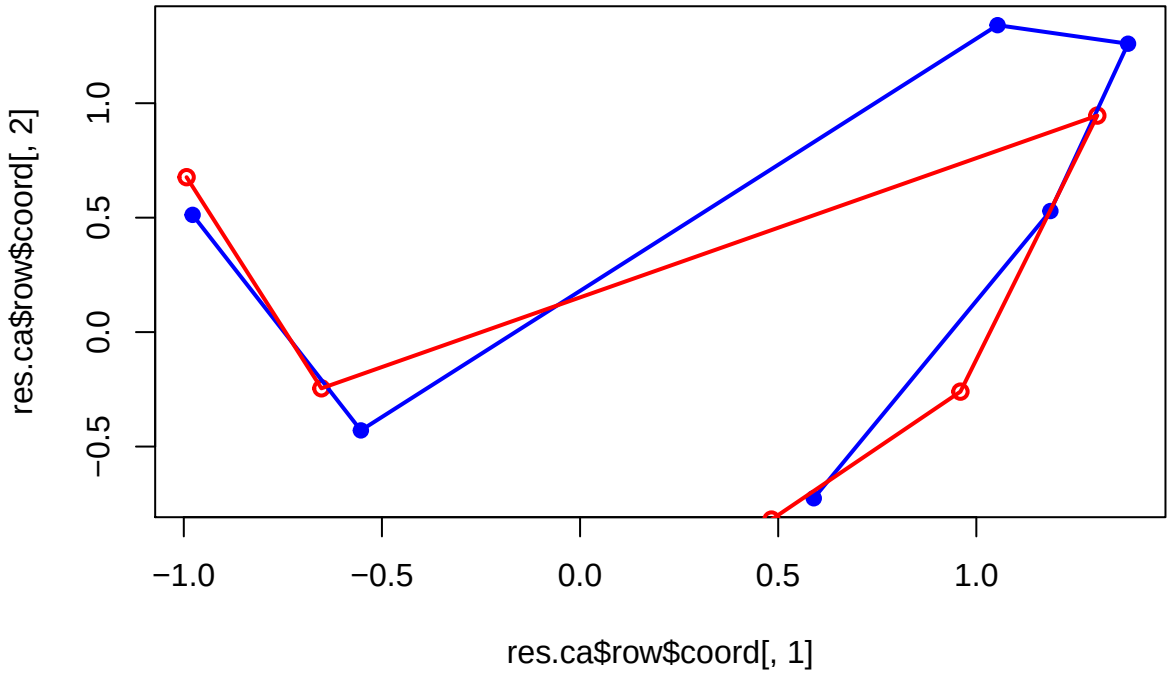
We are now going to take a look to the simple correspondences.

```
res.ca <- CA(tt)
```



```
plot(res.ca$row$coord[,1],res.ca$row$coord[,2],pch=19,col="blue")
points(res.ca$col$coord[,1],res.ca$col$coord[,2],lwd=2,col="red")
```

```
lines(res.ca$row$coord[,1],res.ca$row$coord[,2],lwd=2,col="blue")
lines(res.ca$col$coord[,1],res.ca$col$coord[,2],lwd=2,col="red")
```



We can see in the plot, clearly that there are some categories that occur simultaneously in the sample, for instant the trips up to 5 minutes with the cost up to 8, the trips between 5-10 minutes and the costs between 8-11, the same happen with the trips between 10-15 minutes and the costs between 11-18.

```
summary(res.ca)

```

The first thing we can see from the summary is that we have a chi square statistic of 6099.333, great enough to reject the H0, which means the intensity of the relation is high. If we take a look at the variances from the different dimensions, we can see that all together sum more than 1.

5.2 Eigenvalues and dominant axes analysis. How many axes we have to consider

```
mean(res.ca$eig[,1])
```

```
## [1] 0.3343199
```

5.3 Following the kaiser kriteria and the value got in the output, we should retain dimensions with a variance greater than 0.3343199. In this case, the first dimension fulfills this because its variance is 0.751, but it is not enough to work with data so, we would choose 2 o 3 dimensions for this case.

6 MCA analysis for your data should contain:

6.1 Eigenvalues and dominant axes analysis. How many axes we have to consider for next Hierarchical Classification stage?

6.2 Individuals point of view: Are they any individuals "too contributive"? Are there any groups?

6.3 Interpreting map of categories: average profile versus extreme profiles (rare categories)

6.4 Interpreting the axes association to factor map.

6.5 Perform a MCA taking into account also supplementary variables (use all numeric variables) quantitative and/or categorical. How supplementary variables enhance the axis interpretation?

---

7 Hierarchical Clustering (from MCA)

7.1 Description of clusters

7.2 Parangons and class-specific individuals.

7.3 Comparison of clusters obtained after K-Means (based on PCA) and/or Hierarchical Clustering (based on PCA) focusing on Duration target.

7.4 Comparison of clusters obtained after K-Means (based on PCA) and/or Hierarchical Clustering (based on PCA) focusing on the binary target.
